D1 Sponsored onboarding

VERIFIED ON MAINNET

A previously unopened recipient account was created with 0 XLM, an issuer-specific sponsored USDC trustline, and the recipient as its sole signer. The sponsor covered the reserve and fee. No USDC was distributed.

[Recipient account](#)

D2 Pool and recipient workflow

VERIFIED ON TESTNET

A continuous browser recording shows an isolated 50-place private pool created, 50 addresses imported and the pool activated. A listed recipient was onboarded; the operator workspace and Stellar Horizon confirm the transaction. The API returned HTTP 404 for an unlisted address. This recipient used a throwaway test key through the API rather than the Freighter extension.

D3 Reserve release and handover

VERIFIED ON TESTNET

An independent background worker released sponsorship after the recipient held sufficient XLM; the sponsor reserve count fell by three units. A separate transaction transferred sponsorship between two sponsor accounts without a recipient signature.

[Automatic graduation](#)
[Sponsor handover](#)

Verification and scope of the demonstration

The release passed 129/129 isolated PostgreSQL-backed tests, a TypeScript/production build, and a production-dependency audit with zero known advisories. The D2 recording is continuous for operator actions; its final screen labels API/Horizon results rather than pretending to show a Freighter wallet interaction. Real Freighter signing was demonstrated separately on mainnet for D1. Graduation and handover have not been exercised with real mainnet XLM.
